

Operations Control Platform

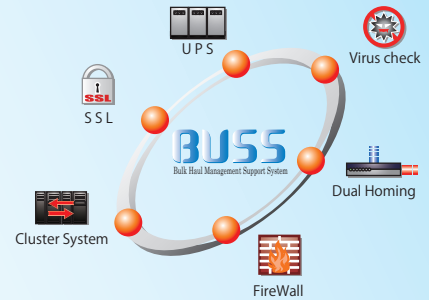

Bulk Haul Management Support System

BUSS is a comprehensive suite of logistics control applications, jointly developed with IBM, that allows Niyac to assist its customers to improve and optimise every aspect of their logistics management control processes. When internet/WEB enabled, BUSS functionalities are accessible from anywhere.

- ✓ Dedicated servers housed in a state-of-the-art data center.
- ✓ 24 X 7 security and monitoring.
- ✓ Automated data-backup system.
- ✓ On-premise, uninterrupted power supply system (UPS)

Niyac Best Practice

Niyac has developed, and constantly improves upon, a standard set of best business practices and rules (Niyac Best Practices, called "NBP") which it employs at all of its facilities throughout its nation-wide network, thus enabling Niyac to variable costs and eliminates errors in all areas of management and day-to-day operations.

Operation Center

Niyac's Operations Center is the "nerve center" by which Niyac controls all aspects of the company's logistics service operations. Moreover, this is where we manage the logistics operations which our customers have entrusted to us on an out-sourced basis, e.g., inventory management, load control, truck dispatch, and so on. This helps our customers to achieve best-of-breed service on a variable-cost basis.

Business Support

Our Business Support Center manages all "back office" functions such as accounting, payroll, billing, and payment of invoices. The Center provides these services for the company as well as for the company's customers that have entrusted their back-office functions to Niyac.
